

## Press Release

**CeBIT 2008, March 4 – 9, 2008**

### **Mobotix presents a wide range of products at CeBIT 2008**

Kaiserslautern/Hanover, CeBIT 2008. The highlights of the Mobotix AG stand (Hall 6, E02) at this year's CeBIT trade fair in Hanover were the presentations of the Q22 hemispheric dome camera, an extensive upgrade to 3.1 megapixels for all existing camera models, a new, innovative ExtIO module and a new software package, MxEasy.

With a single lens, the new Q22 enables a hemispherical 360° allround view. Just one camera is all that is needed to view all four corners of a room. The 'fish-eye' effect typical of this kind of lens can be digitally switched off in the live images.

All of the company's existing camera models now have a standard resolution of 3.1 megapixels and a function enabling digital zooming and panning in high image quality. The cameras themselves record the generated video streams internally, thus reducing the network bandwidth to null.

The new ExtIO module features motion and temperature sensors in addition to a loudspeaker and microphone, opening up many new applications for all Mobotix cameras. They can even be used as intercom systems.

The MxEasy program introduced at CeBIT makes using Mobotix cameras extremely user friendly. The tool has an easily understandable input mask that allows trouble-free installation and operation of the cameras. The intention of MxEasy is to enable users to quickly acquaint themselves with the main control functions, where possible without having to consult an instruction

manual. The program is planned for release in May 2008.

## **Company Profile Mobotix AG:**

At the forefront of technology, Mobotix AG is a European provider of high-resolution digital, network-based video security systems, video management software and system accessories. The company, founded in 1999, operates on a global scale using qualified distributors and commercial business partners. Since July 2006, Mobotix has been active in the US market with a branch office in New York.

Mobotix produces digital megapixel cameras that can record considerably more details than conventional analog video monitoring cameras. The high quality of the images substantially reduces the number of cameras required. In addition, the cameras' network power supply and maintenance-free design make for comparatively low system costs. The decentralized concept of Mobotix with integrated intelligence bridges network failures and bandwidth fluctuations while recording. MxControlCenter, a professional license free video/alarm management software for an unlimited number of cameras and users is available free of charge with every Mobotix camera. The software offers not only fluent images or event research on several cameras but also post image processing, lens distortion correction and synchronized research of events on several cameras.
